

Full Digital Audio

The next audio experience!

Compared with a traditional system, the advantages of the **Full DA** are remarkable:

- 1** A traditional system performs three conversions of the precious audio signal; at the head unit through low quality D/A converters and then A/D and D/A at the DSP. The Audison **Full DA technology** performs one single conversion of the signal from digital into analogue through high quality converters.
- 2** An Audison **Full DA** system is minimalist in its connection compared to a traditional system; An Electric or Optical TOSLINK digital cable going from the head unit to the DSP, then a single AD Link connection capable of transmitting 8 channels of audio from the DSP (bit One, bit Ten D) to the amplifiers. Radiated noise and signal degradation through traditional signal cables are a thing of the past!
- 3** **Full DA** provides the ability of transferring high resolution music **24bit/96kHz** or **24bit/192kHz** as found on DVD-A discs or from other high resolution music files (HI RES LIQUID MUSIC), thus overcoming the sound quality barrier of the CD format (16bit/44.1kHz) to which traditional systems are limited to.

Feel the difference, the Audison Full DA!
